

Bi-Monthly Progress Report
For the Period Beginning January 1, 1973
and Ending February 28, 1973

A. Title of Investigation:

An Interdisciplinary Analysis of ERTS data for Colorado
Mountain Environments Using ADP Techniques

ERTS-1 Proposal Number: SR030/040

B. GSFC Identification Number: UN103
Principal Investigator: R. M. Hoffer

C. The only serious problem encountered during this bi-monthly reporting period occurred because an order for data for Scene ID 1047-17200 was not received. This data was originally ordered December 8, 1972 and reordered February 20, 1973 (Section J). Lack of data for this particular scene has caused some delays in the Ecological Inventory portion of the contract.

D. During this bi-monthly reporting period, a number of different analysis studies were carried out at LARS. These included (1) a study of the capability to spectrally identify cover type within topographic shadow areas, and examination of the spectral differences observed between topographic shadow areas and cloud shadow areas and certain water bodies; (2) a study was initiated to examine the spectral separability of clouds and snow cover; (3) the study involving mapping of the areal extent and temporal changes in snow cover was initiated, and (4) the spectral differentiation of certain lithologic units in the San Juan Test Site and computer mapping of the area resulted in some interesting findings.

In the topographic shadow study, we found that some spectral differences did exist for the various cover types within the shadow area, but these were so subtle that we believe that such differentiation within the shadow area will generally be unreliable. This would indicate that in future vegetation studies, it would be desirable to obtain the data under conditions of minimum shadow.

Differentiation of topographic shadow, cloud shadow, and water bodies proved to be very difficult and time consuming. In some cases the standing water bodies could be easily differentiated but in other cases it was extremely difficult to separate standing water from cloud shadow. Separation of the cloud shadow and standing water body was achieved with an accuracy of in excess of 90%, but only with difficulty. Further efforts will be made to study the reliability of ADP techniques when cloud shadow and topographic shadow features are present in the data.

(E73-10348) AN INTERDISCIPLINARY ANALYSIS
OF ERTS DATA FOR COLORADO MOUNTAIN
ENVIRONMENTS USING ADP TECHNIQUES
Bimonthly Progress Report, 1 Jan. - 28
(Purdue Univ.) 8 p HC \$3.00 CSCI 08F

With receipt of suitable data from both the San Juan and Indian Peaks sites, the study to spectrally separate snow from clouds was initiated. To date, data from three tapes has been analyzed (Scene ID: 1101-17203, 1119-17204, and 1136-17141). Both snow and clouds appeared to saturate the scanner on data from the San Juan Site (Scene ID's: 1101-17203; 1119-17204). However, snow and clouds did not appear to have saturated the scanner on the Indian Peaks data (Scene ID: 1136-17141), but spectral separation still appears unreliable. Major differences between these data are: (1) sun elevation of 33° for 1101-17203 versus 23° for 1136-17141 and (2) the amount and quality of snow cover, both of which are considerably greater for 1136-17141. Work will continue on this project with receipt of more data.

The project to map areal extent and variations in snow cover began with the receipt of data from Scene ID 1119-17204. A classification map showing the snow cover in this scene was generated and will be compared with data obtained later this winter and spring. Two of the initial classification maps were sent to INSTAAR for further analysis and interpretation. A method was also devised during this bi-monthly period for calculating irregular areas, such as watershed boundaries, using the LARSYS techniques. Snow cover within the primary study watershed was estimated with an accuracy of greater than 95%. Further evaluation of these techniques and results is underway.

The results of the geologic study are reported under Section E of this report.

- D.2 Work at INSTAAR during the last bi-monthly period was primarily involved with instrumentation of the DCP, updating field data information and maps, and analysis of LARS generated computer maps for Scene ID: 1119-17204.

DCP instrumentation provides data in six channels which monitor temperature, net radiation, and solar radiation. Reformatting of platform output to readable format has been completed. In addition, a storage and retrieval system which facilitates easy access to any of the data has been set up.

All macrovegetation cover type maps have been transcribed to a base that is compatible with geomorphic and surface form data. The completed quads are being transferred to mylar transparencies at the same scale as the 7 1/2 minute USGS topo quads. It is expected that these will be completed in March.

The surface water and snow cover inventory has been completed. Currently this information is being inserted into the data storage/retrieval system.

A computer program designed to generate shadow maps as a function of topography and sun angle has been completed. Shadow maps will be generated as digitized topographic map data from Purdue is received.

A computer map of the San Juan subframe has been received. Examination of this computer map reveals that in shadow free areas for which ground truth knowledge is available, one computer class corresponds to deciduous cover (quaking aspen and willow); one class corresponds to coniferous cover (Engleman spruce and sub-alpine fir); and a third class corresponds to areas containing mixed coniferous and deciduous cover or mixed coniferous cover.

Efforts over the next two months will be directed towards integrating remaining ground truth into the storage and retrieval system and continued analysis of the existing subframe. Channels 7 and 8 of the DCP should be operable and the data obtained will be reformatted and inserted into the retrieval system. Preliminary analysis to determine accuracy of DCP data will also be initiated.

E. An area in the Southwestern corner of the San Juan Site was analyzed with data from Scene ID 1119-17204 to identify surface lithologic and physiographic features. Results from a supervised classification indicate good visual correlation with late Mesozoic and early Cenozoic shales and sandstones as they appear on a geologic map of the area. Additionally, Pleistocene and Recent alluvial deposits, including sand and gravel aggregate materials, are clearly separable when using LARSYS data and analysis techniques. With minimal manual analysis of the resultant ADP classification, surface location of coal-bearing strata can be interpolated within the Cretaceous lithologies of the area.

F. No reports, etc., were released during this bi-monthly period.

G. There were no changes suggested during this bi-monthly period.

H. Attached is an updated copy of the Standing Order Form, dated January 15, 1973.

I. Appropriate ERTS Image Description Forms are attached.

J. The second data request form for data from Scene ID 1047-17200, dated February 20, 1973 is attached.

K. As per written request from Goddard dated January 31, 1973 by Stanley C. Fredin, the following comments relate to NASA RB-57F Mission 228:

- (1) Support during this mission was adequate for both San Juan and Indian Peaks Test Sites (Test Site 326).
- (2) Data quality and delivery are both satisfactory.
- (3) This particular set of data will be utilized to define specific hydrologic parameters necessary for the Hydrologic Inventory.

January 15, 1973

317/749-2052

Dr. Arthur Fihelly
NASA
Goddard Space Flight Center
Greenbelt, Maryland 20770

Dear Mr. Fihelly,

Please find enclosed Standing Order Forms for the three contracts UN103, UN127 and UN630 being performed by principal investigators in this Laboratory.

These forms primarily indicate a change requested in the product requirements. At the present time all have been on standing order for computer compatible tape, and it is now evident that sufficient data in this form has been received to carry on our research and to be more selective in future scene requests.

Please be aware that with the advent of the 73 growing season we intend to request again that certain of our test sites be put on standing order for tape.

Sincerely,

D. A. Landgrebe
Director
